FROG LIFE CYCLE

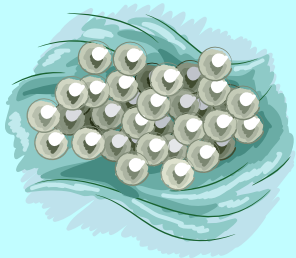

1. In FROGLET stage the lungs and two front legs also grow. Tail of the Froglet shrinks.

2. Adult female frog lays jelly-covered eggs

3. The ADULT FROG is perfectly fit to leave the water and live on the land.

4. Eggs hatch into tiny TADEPOLES. It breathes using gills and use its long tail to swim. Tadpoles eat small water plants and algae

In the circle provided below, reorder 1,2,3,4 as per the correct Frog life cycle stages.
